Major Project Report

SMART SCAN

Project Category: Start-up Based Project

Projexa Team Id- 26E4058

Submitted in partial fulfilment of the requirement of the degree of

BACHELOR OF COMPUTER APPLICATIONS (AI&DS)

Semester-VI

to

K.R Mangalam University

by

AARYAT KHATRI (2301201112) Section-B

Under the supervision of

DR.VANDNA
<Internal Mentor>
Designation

SANJAY SAINI

Director
3 Step Innovation

Department of Computer Science and Engineering
School of Engineering and Technology
K.R Mangalam University, Gurugram- 122001, India
April 2026

DECLARATION

I hereby declare that this project report is my original work and has not been submitted elsewhere. The information presented here is true and correct to the best of my knowledge.

Aaryat Khatri

2301201112

10 April 2026

CERTIFICATE OF STARTUP PROJECT COMPLETION

This is to certify that the startup project titled: “Smart Scan”

Proposed and developed by the following individuals has been **successfully completed** under the **3 Step Innovation Limited** , a recognized incubation unit of **3 Step Innovation Limited**.

Founder(s)/Team Details:

- **Aaryat Khatri**, Roll No./ID: **2301201112**, [SOET, KR Mangalam University]

Incubation Duration: From 01 Jan 2026 to 01 June 2026

Domain: AI

Project Status and Outcome

Current Status: In Early-Stage Commercialization

The team has successfully completed all stages of the incubation process, including **prototype development, validation, and final presentation**, demonstrating innovation, feasibility, and potential for real-world impact in their respective domain.

3 STEP INNOVATION LIMITED DIRECTOR

Name: Sanjay Saini

Designation: Head – 3 Step Innovation Limited

Incubation Center : 3 Step Innovation Limited

Contact Email: admin@mytraveldeal.co.uk

Phone: +44 7516 600592

Date: 06/04/2026

Place: London, United Kingdom

CERTIFICATE

This is to certify that the Project Synopsis entitled, "**SMART SCAN**" submitted by "**AARYAT KHATRI (2301201112)"**to **K.R Mangalam University, Gurugram, India,** is a record of bonafide project work carried out by them under my supervision and guidance and is worthy of consideration for the partial fulfilment of the degree of **Bachelor of Computer Applications** in **Artificial Intelligence & Data Science** of the University.

Dr. Vandna Batra
Internal Mentor [SOET]

Date: 10th April 2026

ABSTRACT

Smart Scan is a digital receipt management system created with the aim of helping people maintain their financial receipts in a neat, secure, and organized manner. In everyday life, we constantly make purchases—whether it's from a supermarket, a pharmacy, a restaurant, an online store, or during travel. Each of these transactions generates a receipt that can become important later on. These receipts might be required for returns, warranty claims, reimbursements, tax purposes, or simply for tracking how much a person spends in a month.

However, most of the time, people either throw receipts into bags or drawers or leave them mixed within emails and downloads. Eventually, when a receipt is needed, it becomes extremely difficult to find, and in many cases, it may already be lost or damaged. This is a common and frustrating problem for students, professionals, business owners, freelancers, and almost every individual who makes regular financial transactions.

Smart Scan attempts to solve this everyday problem by allowing users to upload receipts easily using photos or digital files. Once uploaded, the system extracts important details from the receipt, such as the date, merchant name, tax amount, total cost, and any other clearly visible key information. These details are then saved digitally in a proper, structured format, keeping records clean and easy to navigate. One of the main benefits is that users no longer need to worry about keeping physical receipts safe. Digital storage ensures that receipts do not fade, tear, or get misplaced. Everything remains accessible in one organized place whenever the user needs it.

Another key aspect of Smart Scan is its ability to categorize receipts automatically. It groups expenses into categories like food, groceries, travel, utilities, health, shopping, and more. This helps users understand their spending patterns more clearly. Instead of going through dozens of paper receipts, users can simply filter their records based on category or date. This makes budgeting easier and helps users become more aware of their financial habits. Smart Scan also reduces paper usage and supports a more eco-friendly way of managing documents, something that is becoming increasingly important in today's digital age.

In addition to improving organization, Smart Scan plays an important role in changing the way people handle their daily financial records. Many individuals do not actively maintain their receipts because they believe it is not necessary or because they find the process inconvenient.

Over time, this leads to a lack of financial awareness, where users are unable to track how much they are spending or where their money is going. By providing a simple digital platform, Smart Scan encourages users to develop a habit of saving and reviewing their receipts regularly. This habit can gradually improve financial discipline and help users make better spending decisions.

Another major advantage of Smart Scan is the reduction of time and effort required to manage receipts. In traditional methods, users often need to sort receipts manually, store them in files, and search through them when required. This process becomes even more difficult when receipts accumulate over time. Smart Scan eliminates this issue by automatically organizing receipts in a structured format. Users can quickly locate any receipt by searching for keywords such as date, merchant name, or amount. This significantly reduces the time spent on searching and improves overall efficiency.

The system also supports better financial planning. When users have access to categorized expense data, they can easily identify patterns in their spending. For example, they can see how much they are spending on food, travel, shopping, or utilities each month. This information helps users set budgets and control unnecessary expenses. Smart Scan acts as a helpful tool for individuals who want to improve their financial management without using complex accounting systems.

Another important benefit of Smart Scan is its ability to maintain long-term records. Physical receipts are not reliable for long-term storage because they fade, tear, or get lost. In contrast, digital receipts remain safe and readable for years. Smart Scan ensures that all receipts are stored securely and can be accessed whenever needed. This is particularly useful for purposes such as tax filing, audits, or business recordkeeping, where users may need to refer to older receipts.

They can simply log in and view their receipts whenever required.The system also supports flexibility in terms of input formats. Users can upload receipts in different formats such as images or documents, which makes it convenient for both physical and digital receipts. This ensures that users do not face limitations while using the system.

Another aspect worth noting is the user-friendly nature of Smart Scan. The system is designed in a way that even users with minimal technical knowledge can use it easily. The interface is simple, and the steps involved in uploading and viewing receipts are straightforward. This makes Smart Scan accessible to a wide range of users, including students, professionals, and small business owners.

In addition to these features, Smart Scan also contributes to environmental sustainability by reducing paper usage. As more users shift to digital receipt management, the dependency on physical receipts decreases. This small change can have a positive impact on reducing paper waste and promoting eco-friendly practices.

Security is another important factor considered in Smart Scan. Since financial data is sensitive, it is important to ensure that it is stored safely. The system is designed to store data securely so that users can trust the platform with their information. This adds to the reliability of the system and encourages users to use it regularly.

Overall, Smart Scan is not just a tool for storing receipts; it is a complete solution for improving financial organization. It combines simplicity, efficiency, and accessibility to provide a practical solution to a common problem. By digitizing receipts and organizing them effectively, Smart Scan helps users save time, reduce stress, and maintain better control over their financial records. It transforms a routine task into a simple and manageable process, making it easier for users to stay organized in their daily lives.

1. INTRODUCTION

Managing receipts is something most people have to deal with regularly, but very few actually organize them properly. Whether the receipt comes from a shop, a restaurant, a medical store, an online purchase, or a travel booking, it is always meant to serve as proof of a transaction. These receipts contain important information like the date, amount paid, items purchased, and merchant details. Although they look small and insignificant at first, they become important whenever someone needs to track their expenses, return a product, check a warranty period, or claim reimbursement from a company or institution. The problem starts when these receipts begin piling up and eventually get lost, torn, faded, or buried under other papers.

Today, most people have mixed types of receipts—some in paper form and others in digital form. But even digital receipts are not easy to manage because they get scattered across apps, emails, screenshots, downloads, and phone galleries. When someone needs to look for a specific receipt after weeks or months, they end up wasting a lot of time searching across different folders or piles of papers. This leads to frustration and poor financial record-keeping. Many people want to track their expenses, but the process becomes so tiring that they simply avoid it.

Smart Scan is introduced as a simple and helpful way to deal with this everyday problem. The idea is to make receipt management less stressful by storing everything digitally in one place. Instead of keeping paper receipts safe or worrying about losing them, a person can simply take a photo of the receipt or upload a file and let the system save it. Once saved, the receipt is not just an image sitting in the system; its important details are also identified and stored in an organized format. This makes future searching much easier because users can filter their receipts by date, category, merchant, or amount.

Smart Scan also supports category-wise storage, which helps users understand where they spend the most—whether on food, travel, shopping, utilities, or other areas. This small feature can help users plan their monthly budgets better and develop healthier spending habits. The whole idea of Smart Scan is to make financial organization simple and practical for everyday life without requiring any advanced technical skills. Anyone—from students to working professionals to small business owners—can use it comfortably.

Another important aspect to consider in receipt management is the increasing volume of transactions in modern life. With the rise of online shopping, digital payments, subscriptions, and service-based transactions, individuals now generate far more receipts than before. Earlier, people only dealt with a few receipts occasionally, but now it has become a daily activity. This increase in transaction frequency makes it even more difficult to manage receipts manually. Without a proper system, these receipts quickly become unmanageable and lead to disorganized financial records.

In addition, the shift toward cashless transactions has changed the nature of receipts. While digital payments provide convenience, they also generate digital receipts that are often stored in different formats and locations. Some receipts are received via email, some as SMS messages, and others as downloadable files. This scattered storage creates confusion when users try to locate a specific receipt. Smart Scan helps solve this issue by bringing all receipts—both physical and digital—into one centralized platform. This unified approach simplifies the entire process and ensures that users do not have to search across multiple sources.

Another challenge in traditional receipt management is the lack of consistency. People often store some receipts while ignoring others, leading to incomplete records. This inconsistency makes it difficult to analyze spending patterns accurately. For example, if a user stores only a portion of their receipts, their expense tracking will not reflect the actual situation. Smart Scan encourages consistent record-keeping by making the process quick and effortless. Since uploading a receipt takes only a few seconds, users are more likely to store all their receipts regularly.

Smart Scan also supports better decision-making by providing organized data. When users have access to clear and structured information about their expenses, they can make informed choices about their spending. For instance, they may realize that they are spending too much on dining or shopping and decide to adjust their budget accordingly. This kind of insight is difficult to achieve without proper record management.

Another advantage of Smart Scan is its ability to reduce dependency on physical storage methods. Traditional methods such as storing receipts in files or folders require physical space and effort.

Over time, these files become bulky and difficult to manage. In contrast, digital storage eliminates the need for physical space and provides a cleaner, more efficient solution. Users can store hundreds or even thousands of receipts without worrying about space limitations.

The system also improves accessibility and convenience. Since receipts are stored digitally, users can access them anytime using their device. This is particularly useful in situations where immediate access is required, such as during product returns or verification of transactions. Instead of searching through physical documents, users can simply open the system and retrieve the required receipt within seconds.

Another key point is the role of automation in simplifying tasks. Smart Scan reduces the need for manual effort by automatically extracting important details from receipts. This not only saves time but also reduces the chances of human error. Manual entry can often lead to mistakes, especially when dealing with large numbers of receipts. Automation ensures accuracy and consistency in data handling.

Smart Scan also aligns with modern technological trends where digital solutions are replacing traditional methods. As more services move online, it becomes essential to adopt systems that support digital workflows. Smart Scan fits well into this trend by providing a digital solution for receipt management, making it relevant and useful in today's environment.

Furthermore, the system is designed with flexibility in mind. It supports multiple formats and allows users to upload receipts in different ways, ensuring that it can adapt to various user needs. Whether a receipt is in the form of a printed bill or a digital invoice, Smart Scan can handle it efficiently.

Another important factor is user experience. Many systems fail because they are too complicated or require too many steps. Smart Scan focuses on simplicity, ensuring that users can easily understand and use the system without any technical difficulties. The goal is to make the process as smooth as possible so that users feel comfortable using the system regularly.

In conclusion, the introduction of Smart Scan addresses multiple challenges associated with receipt management. It provides a practical, efficient, and user-friendly solution that simplifies the process of storing, organizing, and retrieving receipts. By combining digital storage, automation, and categorization, Smart Scan transforms a common problem into a manageable task. It not only improves organization but also supports better financial awareness and decision-making. The system reflects the growing need for digital solutions in everyday life and offers a reliable approach to handling financial record

2. MOTIVATION

The motivation behind creating Smart Scan comes mainly from real-life issues that almost everyone faces with receipts. Most people have experienced situations where they urgently needed a receipt but could not find it anywhere. It may have been needed to claim a refund, apply for a return, settle accounts with a workplace, or check spending for the month. Because receipts are small pieces of paper, they often get misplaced easily. Many people put receipts into their wallets or pockets and forget about them. Later, when they search for them, the receipts may be torn, faded, or completely lost.

In addition to this, a lot of people today are trying to maintain better control of their financial habits. They want to know where their money is going, how much they spend every month, and how they can reduce unnecessary expenses. But without proper receipt management, it becomes very difficult to get a clear picture. Some people try to write down their expenses manually in notebooks or spreadsheets, but this takes time and requires discipline. Most people are unable to maintain this habit for long. This again creates the need for a system that makes expense tracking automatic and easy.

The motivation for Smart Scan also comes from the fact that many existing tools are overly complicated. A number of apps available in the market are designed for accounting professionals or large businesses. These tools include many advanced features that regular users do not need. As a result, ordinary people find it difficult to use such apps. They need something simple that handles only the tasks they care about—uploading receipts, storing them, retrieving them, and organizing them clearly.

Furthermore, students and small business owners especially face difficulties during audits, reimbursements, or end-of-year financial summaries. They often have to collect multiple receipts from different time periods, which becomes a stressful process if receipts are not stored properly.

Smart Scan was created with the motivation to eliminate this stress. By digitizing receipts and organizing them neatly, the system gives users peace of mind knowing their documents are safe and always available whenever required.

This project is motivated by the idea of making people's daily financial life easier. Instead of struggling with paper slips and scattered digital files, users can rely on Smart Scan as a single, reliable space for all their receipts.

Another important motivation behind developing Smart Scan comes from the increasing complexity of managing personal and professional expenses. In today's fast-paced lifestyle, people make multiple transactions every day, often without keeping track of them properly. Over time, this leads to confusion when trying to recall where money was spent. Without proper records, it becomes difficult to identify unnecessary expenses or maintain a clear financial overview. Smart Scan is motivated by the need to simplify this process and provide users with a clear and organized way to track their expenses.

A major factor that influenced the development of this system is the inconvenience associated with traditional receipt storage methods. Many people rely on physical storage such as wallets, drawers, or files to keep their receipts. However, these methods are unreliable and difficult to maintain over time. Receipts can easily be misplaced, damaged, or forgotten. Even when stored carefully, they often become disorganized, making it hard to retrieve specific receipts when needed. This inefficiency creates frustration and discourages users from maintaining proper records.

The motivation also comes from the challenges faced during important situations like reimbursements, returns, and audits. In such cases, having access to accurate and well-organized receipts is essential. Many individuals struggle to provide the required documents on time because they cannot locate their receipts. This not only causes delays but can also lead to financial loss.

Smart Scan aims to eliminate these issues by ensuring that all receipts are stored safely and can be accessed instantly whenever required.

Another strong motivation is the growing awareness of financial discipline among individuals. People are becoming more conscious about managing their money and making informed financial decisions. However, without proper data, it is difficult to analyze spending patterns. Smart Scan provides users with categorized and structured information, helping them understand their financial behavior. This enables users to identify areas where they can reduce expenses and improve their savings.

The rise of digital payments has also contributed to the need for better receipt management. Although transactions are becoming more digital, receipts are still scattered across different platforms such as emails, messages, and apps. This creates inconsistency in record-keeping. Smart Scan addresses this issue by providing a single platform where all receipts can be stored and managed together. This unified approach improves convenience and ensures that no important information is lost.

Another motivating factor is the need to reduce manual effort. Traditional methods of recording expenses require users to write down details or enter them into spreadsheets.

This process is time-consuming and prone to errors. Many users start maintaining records but eventually stop because it becomes difficult to keep up with the effort required. Smart Scan reduces this burden by automating the process of extracting and storing receipt data. This makes the system more efficient and encourages regular usage.

The system is also motivated by the importance of accessibility. In many cases, users need to access their receipts while they are away from home or office. Carrying physical documents is not always practical. Smart Scan allows users to access their receipts from any device, making it convenient to retrieve information whenever needed. This flexibility is particularly useful for individuals who travel frequently or handle multiple transactions daily.

Environmental concerns also play a role in motivating the development of Smart Scan. The use of paper receipts contributes to waste, and over time, this has a negative impact on the environment. By promoting digital storage, Smart Scan helps reduce the need for paper and supports eco-friendly practices. This small step can contribute to a larger effort toward sustainability.

Another important motivation is the need for simplicity in technology. Many existing solutions are designed with advanced features that are not necessary for everyday users. These systems can be difficult to understand and use, which discourages adoption. Smart Scan focuses on providing only the essential features in a simple and user-friendly manner. This ensures that users can benefit from the system without facing any complexity.

Furthermore, Smart Scan is motivated by the idea of creating a solution that can be used by a wide range of users. Whether it is a student managing personal expenses, a professional tracking monthly spending, or a small business owner maintaining records, the system is designed to meet different needs. This versatility makes Smart Scan a practical solution for various use cases.

The project is also driven by the need to improve efficiency in daily tasks. Managing receipts is often seen as a small task, but when done manually, it consumes time and effort. By automating and simplifying this process, Smart Scan allows users to focus on more important activities. This improves overall productivity and reduces stress.

In conclusion, the motivation behind Smart Scan is rooted in real-life problems and practical needs. It aims to provide a solution that is simple, efficient, and reliable. By addressing issues such as disorganization, manual effort, lack of accessibility, and poor financial tracking, Smart Scan offers a system that improves the way people manage their receipts. It is motivated by the goal of making everyday financial tasks easier and more manageable for all users.

3. LITERATURE REVIEW

Various studies and articles have highlighted that traditional receipt management methods are outdated and unreliable in today's digital world. Paper receipts, while still used widely, are not suitable for long-term storage because they fade, get damaged, or become unreadable over time. Several research papers mention that thermal-printed receipts can fade in as little as a few months. Because of this, researchers have encouraged the shift toward digital storage of financial documents.

Research on digitization tools explains that using image-based storage and OCR (Optical Character Recognition) helps convert printed text into readable digital text. OCR technology has already been used extensively for scanning invoices, ID cards, business documents, and educational forms. Studies show that OCR reduces human effort and eliminates errors that occur during manual entry. Since Smart Scan uses OCR to extract key information from receipts, it aligns with the direction suggested by past research.

Other literature highlights the benefits of cloud storage for document safety. Researchers state that cloud-based systems make documents more accessible, secure, and easier to retrieve. Unlike physical storage, digital storage cannot be damaged by environmental factors like heat, humidity, or wear and tear. This supports the concept used in Smart Scan, where receipts are stored digitally so users can check them anytime.

Many studies also focus on personal finance management tools. These studies show that people gain more financial awareness when they can categorize expenses and view them in a structured manner. Categorization helps individuals track spending patterns and make better financial decisions. This supports Smart Scan's categorization feature where receipts are automatically sorted into categories like travel, food, groceries, shopping, bills, etc.

Some research also touches on user experience and the importance of keeping tools simple. Studies mention that users do not prefer overly complicated apps that require too many steps or advanced knowledge.

Overall, the literature supports the need for a digital receipt management system like Smart Scan and provides strong backing for its features, such as digitization, OCR, categorization, and cloud-based access.

In addition to the previously discussed studies, further research highlights the growing importance of automation in document handling systems. Automated systems are designed to reduce human effort and improve efficiency by minimizing manual intervention. In the context of receipt management, automation plays a crucial role because it eliminates the need for users to manually read and enter data from receipts. Several studies suggest that automation significantly reduces errors and improves accuracy, especially when dealing with repetitive tasks such as data entry. Smart Scan follows this principle by using OCR technology to automatically extract information from receipt images, making the process faster and more reliable.

Another area of research focuses on data structuring and organization. It has been observed that unstructured data is difficult to manage and analyze, whereas structured data allows for better processing and retrieval. In traditional receipt management, receipts are stored as plain images or paper documents, which makes it difficult to search for specific information. Research suggests that converting such data into structured formats improves usability and accessibility. Smart Scan applies this concept by organizing extracted receipt information into structured fields such as date, amount, and category, enabling users to retrieve data quickly and efficiently.

Studies also emphasize the importance of real-time access to information. In many modern applications, users expect to access their data instantly from any device. Cloud-based storage systems have been widely adopted because they provide flexibility, scalability, and remote access. Research indicates that cloud storage not only improves accessibility but also ensures data safety and backup. Smart Scan incorporates this approach by storing receipts digitally, allowing users to access them anytime without worrying about physical loss or damage.

Another important aspect discussed in literature is user behavior and interaction with digital systems. Researchers have found that users prefer applications that are simple, intuitive, and easy to use.

Complex systems with multiple features often discourage users, especially those who are not technically skilled. Therefore, many studies recommend designing systems with a focus on simplicity and usability. Smart Scan follows this recommendation by offering a clean and straightforward interface that allows users to perform tasks such as uploading, viewing, and searching receipts without difficulty.

Research in personal finance management also highlights the importance of tracking and analyzing expenses. Studies show that individuals who maintain organized records of their spending are more likely to manage their finances effectively. Categorization of expenses plays a key role in this process, as it helps users identify spending patterns and make informed decisions. Smart Scan supports this by categorizing receipts into different groups, allowing users to monitor their expenses in a structured manner.

Furthermore, literature on digital transformation indicates a shift from traditional paper-based systems to digital solutions across various domains. This shift is driven by the need for efficiency, convenience, and sustainability. Digital systems reduce dependency on physical documents and provide long-term storage solutions. Smart Scan aligns with this trend by offering a digital alternative to paper-based receipt management.

Another research area focuses on data security and privacy. As more systems move to digital platforms, ensuring the safety of user data becomes critical. Studies emphasize the need for secure storage and controlled access to sensitive information. Smart Scan considers this aspect by implementing secure storage methods, ensuring that users can trust the system with their financial data.

Additionally, research highlights the importance of scalability in digital systems. As the amount of data increases, systems should be able to handle large volumes without affecting performance. Cloud-based solutions are often preferred because they can scale according to user needs. Smart Scan follows this approach by using a storage system that can manage increasing amounts of receipt data efficiently.

Another key finding in literature is the importance of integration between different system components. A well-designed system should ensure smooth interaction between input, processing, storage, and output stages. This integration improves overall performance and user experience. Smart Scan is designed with a layered approach where each stage—upload, extraction, storage, and retrieval—works together seamlessly.

Research also suggests that digital tools should focus on solving real-world problems rather than adding unnecessary features. Many applications fail because they try to include too many functions, making them complicated and difficult to use. Smart Scan focuses on essential features that directly address the problem of receipt management, ensuring that the system remains practical and user-friendly.

Finally, studies on environmental impact highlight the benefits of reducing paper usage. Digital solutions contribute to sustainability by minimizing the need for physical documents. By promoting digital storage of receipts, Smart Scan supports eco-friendly practices and aligns with global efforts to reduce paper waste.

In conclusion, the literature strongly supports the approach taken by Smart Scan. The system integrates key concepts such as automation, structured data, cloud storage, user-friendly design, and financial tracking. These concepts are backed by research and have proven to be effective in improving document management systems. Smart Scan builds upon these findings to provide a solution that is both practical and aligned with modern technological trends.

4. GAP ANALYSIS

Even though technology has advanced a lot, there are still very few simple tools available for everyday receipt management. Many applications currently available are focused on business accounting rather than daily expense tracking. This creates a gap for regular users who simply want a place to keep their receipts organized. Most people do not need advanced accounting features—they only need a clean, straightforward space to store and find receipts easily.

One major gap is that most scanning apps do not extract meaningful details from receipts. They allow users to save an image, but to find the receipt later, the user must remember exactly what it looked like or when it was uploaded. This defeats the purpose of digital organization. Smart Scan fills this gap by extracting details automatically, making it easier to search based on text.

Another gap is the absence of categorization. If receipts are not grouped into categories, they become difficult to manage once the number increases. Many existing tools lack simple filtering options, which results in users wasting time scrolling through hundreds of stored documents. Smart Scan solves this by assigning categories like food, travel, shopping, bills, and healthcare.

A gap also exists in accessibility. Some tools require paid subscriptions or complicated registration processes, which discourage ordinary users. Some applications require high-end devices or advanced features that not everyone can access. Smart Scan avoids these problems by using simple, widely accessible technology that does not demand advanced technical knowledge.

Additionally, existing apps often focus only on digital receipts and do not support paper receipts well. This is a clear gap because paper receipts are still widely used in stores and local markets. Smart Scan supports both types—paper receipts can be uploaded as images, and digital receipts can be added as files.

Finally, users often complain that many apps store receipts but do not provide an easy way to retrieve or analyze them. Smart Scan bridges this gap by offering search filters and categorization to help users find receipts quickly.

By addressing all these gaps, Smart Scan becomes a practical solution for real-world users who need a simple and effective receipt management system.

In addition to the gaps already discussed, another important limitation in existing systems is the lack of integration between receipt storage and meaningful data usage. Many applications allow users to upload or store receipts, but they do not provide useful insights based on the stored data. As a result, users are left with a collection of images without any practical benefit. This limits the usefulness of such systems because storing receipts alone does not help users understand their spending behavior. Smart Scan addresses this issue by not only storing receipts but also organizing and categorizing them, making the data more meaningful and usable.

Another significant gap is the absence of proper search functionality in many existing tools. Even when receipts are stored digitally, users often struggle to find specific receipts because there is no effective way to search based on key details such as date, amount, or merchant name. This forces users to scroll through multiple entries, which can be time-consuming and frustrating. Smart Scan fills this gap by enabling users to search for receipts using extracted information, making the retrieval process faster and more efficient.

There is also a gap in the handling of mixed receipt formats. Most systems are designed to handle either digital receipts or scanned images, but not both effectively. In real-life scenarios, users deal with a combination of physical and digital receipts. This inconsistency creates difficulties in managing records. Smart Scan solves this problem by supporting multiple input formats, allowing users to upload both scanned images of paper receipts and digital files in a single system.

Another issue observed in existing solutions is the lack of proper organization when the volume of data increases. As users store more receipts over time, the system becomes cluttered if there is no proper categorization or grouping mechanism. This reduces the usability of the system and makes it difficult to manage large datasets. Smart Scan addresses this gap by implementing categorization logic, ensuring that receipts are grouped into meaningful categories. This makes it easier for users to manage and review their records even as the number of receipts grows.

A further gap exists in the area of user accessibility. Many applications are either too complex or require advanced technical knowledge, which makes them unsuitable for general users. Some systems have complicated interfaces or require multiple steps to perform simple tasks, which discourages users from using them regularly. Smart Scan focuses on simplicity and ease of use, ensuring that even users with minimal technical knowledge can operate the system comfortably.

Another gap is related to data reliability and consistency. In manual systems, there is a high chance of errors due to incorrect data entry or incomplete records. Even in some digital systems, data may not be properly validated, leading to inconsistencies. Smart Scan reduces this problem by extracting data directly from receipts and organizing it in a structured format, ensuring consistency and accuracy.

Additionally, many existing tools do not provide a centralized solution for receipt management. Users often rely on multiple platforms to store different types of receipts, such as email for digital receipts and physical storage for paper receipts. This lack of centralization creates confusion and makes it difficult to maintain a complete record. Smart Scan addresses this gap by providing a single platform where all receipts can be stored and managed together.

Another important gap is the lack of scalability in some systems. As the number of users or data increases, the performance of the system may degrade. This limits the long-term usability of the application. Smart Scan is designed to handle growing data efficiently, ensuring that the system remains functional even as more receipts are added over time.

There is also a gap in providing meaningful feedback to users. Many systems store data but do not help users understand it. Without proper insights, users cannot take advantage of the stored information. Smart Scan partially addresses this gap by organizing receipts into categories, which helps users gain a basic understanding of their spending patterns.

Furthermore, cost and accessibility remain major issues in existing solutions. Many advanced tools require paid subscriptions or have limited free features, which discourages users from adopting them. Smart Scan aims to provide a solution that is simple and accessible without unnecessary financial burden, making it suitable for a wider audience.

Finally, another gap lies in the lack of adaptability of existing systems. Many tools are designed for specific use cases and do not adapt well to different user needs. Smart Scan is designed to be flexible, allowing it to be used by students, professionals, and small businesses alike.

5. PROBLEM STATEMENT

People face real difficulties when it comes to storing and managing receipts. Paper receipts get lost very easily because they are small and not durable. They can tear in a wallet, get crumpled in a bag, fade due to heat, or accidentally get thrown away. Once they are gone, the information becomes irrecoverable. On the other hand, digital receipts also get misplaced because they remain scattered across email inboxes, messages, downloads, or screenshots. This mixture of paper and digital receipts makes it difficult to maintain a proper financial record.

When people need receipts for audits, returns, reimbursements, or tax filing, they spend a lot of time searching for them. Many times, they cannot find the receipt at all, or they find it in a damaged state that is unreadable. This not only wastes time but also creates unnecessary stress. Small businesses and freelancers face even more difficulties because they deal with a higher number of receipts, and missing even one important receipt can cause financial issues.

Manual tracking methods, like writing expenses in a notebook or maintaining a spreadsheet, sound simple but require consistent effort. Many people start but do not continue because it becomes time-consuming. Additionally, manually organizing receipts into categories becomes tiring after some time.

The core problem is the absence of a single, simple system where people can store, manage, organize, and retrieve receipts effortlessly. Without such a system, financial tracking becomes messy and unstructured. Smart Scan is designed to solve this exact problem by providing a digital platform where receipts can be uploaded instantly and saved safely. The system extracts important details and organizes everything neatly so users do not have to dig through piles of paper. It ensures that receipts remain readable, accessible, and well-arranged at all times.

In addition to the issues already discussed, another major problem in receipt management is the lack of a systematic approach followed by users. Most individuals do not have a defined method for storing receipts. Some keep them in wallets, others store them in random folders, while some rely on email storage. This inconsistency creates confusion and makes it difficult to maintain a complete and reliable record of financial transactions.

Another problem is the difficulty in retrieving specific information from receipts. Even when users manage to store receipts properly, finding a particular receipt becomes a challenge. For example, if a user wants to locate a receipt from a specific date or a particular store, they often have to go through multiple documents manually. This process is time-consuming and inefficient, especially when dealing with a large number of receipts. The absence of an efficient search mechanism further complicates the situation.

There is also a significant issue related to the readability of receipts. Many paper receipts are printed using thermal printing, which fades over time. As a result, even if the receipt is physically available, the information on it may no longer be readable. This leads to loss of important data and makes the receipt useless for future reference. Digital storage of receipts becomes essential to preserve this information in a readable format.

Another important problem is the lack of proper expense tracking. While receipts contain valuable information about spending, most users do not utilize this information effectively. Without organized data, it is difficult to analyze spending patterns or identify areas where expenses can be reduced. This results in poor financial management and lack of awareness about personal or business spending habits.

The problem is further intensified in cases where users need to provide proof of transactions. Situations such as product returns, warranty claims, reimbursements, and audits require accurate and accessible receipts. If the required receipt is missing or cannot be found, it can lead to financial loss or inconvenience. This highlights the importance of maintaining receipts in an organized and accessible manner.

Another issue is the duplication or mismatch of financial records. In some cases, users may have multiple receipts for similar transactions or may forget to store certain receipts altogether. This creates inconsistencies in financial records and makes it difficult to maintain accurate data. Without proper organization and validation, such issues can go unnoticed and lead to errors in financial reporting.

There is also a lack of integration between different sources of receipts. Users often receive receipts from multiple platforms, such as physical stores, online shopping websites, payment applications, and email services. Managing receipts from all these sources separately creates complexity and increases the chances of missing important records. A unified system is required to bring all receipts together in one place.

Another problem is the time and effort required for manual management. Sorting, organizing, and maintaining receipts manually requires consistent effort, which many users find difficult to sustain. Over time, this leads to neglect of receipt management, resulting in disorganized records. A system that reduces manual effort and automates key processes is essential to address this issue.

Security and privacy are also concerns when dealing with financial records. Users need to ensure that their receipt data is stored safely and is not accessible to unauthorized individuals. Without a secure system, users may hesitate to store sensitive information digitally. This creates a need for a system that ensures data security while providing easy access to authorized users.

Another challenge is the lack of scalability in traditional methods. As the number of receipts increases, managing them becomes increasingly difficult. Physical storage methods cannot handle large volumes of data efficiently, and even digital storage without proper organization can become cluttered. A scalable system is required to manage growing amounts of data without affecting performance.

Many individuals do not realize the benefits of organized receipt management until they face a problem. This lack of awareness contributes to poor record-keeping practices and highlights the need for a system that encourages users to maintain their records regularly.

In conclusion, the problem of receipt management is not limited to storage alone but involves multiple challenges such as organization, retrieval, readability, accuracy, and accessibility

6. OBJECTIVES

The main objective of Smart Scan is to provide a smooth and reliable way for users to manage their receipts digitally. One goal is to eliminate the dependency on physical papers by allowing easy upload of receipts through photos or files. This ensures that receipts remain safe from physical damage and are always available when needed.

Another important objective is to capture key information from each receipt, such as the date, merchant name, total amount, and tax details. Extracting this information automatically reduces the user's effort and makes the system more efficient. These details also help in sorting and managing receipts later.

A major objective of Smart Scan is to organize receipts into categories. By grouping receipts under categories like food, travel, shopping, healthcare, groceries, and utilities, users get a clear overview of their spending. This not only makes the system organized but also supports better financial planning.

Smart Scan also aims to make searching easier. Users should be able to quickly locate any receipt by typing the date, amount, or category. This saves time and reduces frustration. Another objective is to store all data securely so that users can access their receipts anytime without worrying about data loss.

Overall, Smart Scan aims to simplify the entire receipt management process by making it digital, organized, and easy to use.

In addition to the primary objectives already discussed, another important objective of Smart Scan is to enhance the overall efficiency of receipt management.

The system aims to reduce the time required to handle receipts by simplifying the entire process. Instead of manually storing, sorting, and searching receipts, users can rely on Smart Scan to perform these tasks quickly and accurately. This improvement in efficiency allows users to focus on more important activities rather than spending time managing documents.

Another key objective is to improve data accuracy and consistency. Manual entry of receipt details often leads to errors, especially when dealing with multiple receipts. Smart Scan aims to minimize these errors by automatically extracting information directly from receipt images. This ensures that the stored data is accurate and consistent across all records. Consistency in data also makes it easier to analyze and retrieve information when needed.

The system also aims to provide better visibility of financial records. By organizing receipts into categories and storing them in a structured format, users can gain a clear overview of their spending.

This visibility helps users understand their financial habits and identify areas where they can improve. For example, users can easily see how much they spend on different categories such as food, travel, or shopping, which can help them manage their budgets more effectively.

Another important objective is to ensure accessibility of data. Smart Scan is designed to allow users to access their receipts anytime and from anywhere. This flexibility is particularly useful for users who need to retrieve receipts while traveling or working remotely. The system ensures that users do not have to depend on physical documents, making the process more convenient and efficient.

Smart Scan also aims to provide a user-friendly experience. The system is designed with simplicity in mind so that users can easily understand and use it without requiring technical knowledge. The interface is kept clean and intuitive, allowing users to perform tasks such as uploading, viewing, and searching receipts with minimal effort.

Another objective is to ensure secure storage of data. Since receipts contain financial information, it is important to protect this data from unauthorized access. Smart Scan aims to provide a secure environment where user data is stored safely and can only be accessed by authorized individuals. This builds trust among users and encourages them to use the system regularly.

The system also aims to support long-term record keeping. Users often need to refer to old receipts for purposes such as tax filing, audits, or financial analysis. Smart Scan ensures that receipts are stored in a way that they remain accessible and readable for a long period. This eliminates the risk of losing important information over time.

Another objective is to promote better financial discipline among users. By providing organized and easily accessible data, Smart Scan encourages users to review their expenses regularly. This helps them develop better financial habits and make informed decisions about their spending. Over time, this can lead to improved financial stability and awareness.

Smart Scan also aims to reduce dependency on paper-based systems. By encouraging users to store receipts digitally, the system helps minimize paper usage. This contributes to environmental sustainability and supports eco-friendly practices. Reducing paper clutter also makes physical spaces cleaner and more organized.

Another important objective is scalability. The system is designed to handle a growing number of receipts without affecting performance. As users continue to upload more receipts over time, the system should be able to manage the data efficiently. This ensures that Smart Scan remains useful even as the volume of data increases.

The system also aims to provide quick retrieval of information. Users should be able to find any receipt within seconds using search and filter options. This objective is important to improve user experience and make the system practical for everyday use.

Additionally, Smart Scan aims to integrate different functionalities into a single platform. Instead of using multiple tools for storing, tracking, and analyzing receipts, users can perform all these tasks within one system. This integration simplifies the process and reduces the need for multiple applications.

Another objective is to ensure flexibility in usage. The system should support different types of users and use cases. Whether it is an individual managing personal expenses or a small business maintaining financial records, Smart Scan is designed to meet various needs.

Finally, the overall objective of Smart Scan is to provide a complete solution for receipt management that is simple, efficient, and reliable. By focusing on automation, organization, accessibility, and user experience, the system aims to transform the way users handle their financial documents. It provides a practical approach to solving a common problem and helps users maintain better control over their financial records.

7. TOOLS / TECHNOLOGY USED

The Smart Scan system uses simple, accessible technologies that are easy to understand and implement. The main tools used are HTML, CSS, and JavaScript. HTML is used to structure the web pages, CSS gives them a clean and readable design, and JavaScript handles user interactions, such as uploading files and navigating between different sections.

For receipt uploading, the system uses a basic image upload module. This allows users to either take a photo of a physical receipt or choose an existing receipt file from their device. The system supports common file formats such as JPEG, PNG, PDF, TIFF, and HEIC so that users do not face problems when uploading different types of receipts.

The project also uses a simple OCR (Optical Character Recognition) tool that reads text from the uploaded receipt. This OCR extracts the main details like merchant name, date, and total amount. The extracted details are then saved into the system for easy searching later.

To keep everything organized, Smart Scan uses a basic database-like structure. Each receipt is stored along with its extracted information so that the user can view it anytime. The system also uses a simple login setup so each user has their own space to store receipts safely.

Cloud-style storage is used to make sure that users can access their receipts from anywhere. Categorization logic is used to group receipts according to their type, which makes the system more organized. Overall, the tools selected for Smart Scan are chosen to keep the system simple, efficient, and user-friendly.

In addition to the tools already mentioned, it is important to understand how each technology contributes to the overall functionality of the Smart Scan system.

The selection of tools has been done carefully to ensure that the system remains simple, efficient, and easy to implement while still delivering all required features. The technologies used are widely available and commonly used in web-based applications, making the system practical and accessible.

The frontend of the system is built using HTML, CSS, and JavaScript. HTML is responsible for creating the basic structure of the web pages, such as forms, buttons, and display sections. CSS is used to enhance the visual appearance of the system by adding styles, colors, layouts, and responsiveness. JavaScript plays a key role in adding interactivity to the system.

Together, these technologies create a smooth and user-friendly interface. Another important component of the system is the image upload functionality. This feature allows users to either capture a photo of a receipt using their device camera or upload an existing file.

The system is designed to support multiple file formats such as JPEG, PNG, PDF, TIFF, and HEIC. This ensures that users can upload receipts without worrying about format compatibility. The flexibility in file formats makes the system more convenient and practical for real-world use.

OCR (Optical Character Recognition) technology is one of the most important tools used in Smart Scan. OCR is responsible for reading the text from receipt images and converting it into digital data. This eliminates the need for manual data entry and significantly reduces the effort required from users. The OCR tool identifies key information such as the merchant name, date, amount, and tax details. This extracted data is then processed and stored in a structured format. The use of OCR improves both speed and accuracy in handling receipt data.

The system also uses a database structure to store extracted information. This database is designed to organize receipt data in a structured manner, making it easy to retrieve and manage.

Each receipt is stored along with its associated details, allowing users to search for specific records quickly. The structured storage ensures that data remains consistent and organized, even as the number of receipts increases.

Cloud-based storage plays a crucial role in ensuring that receipt images are stored securely and can be accessed from anywhere. Unlike local storage, cloud storage provides better reliability and scalability. Users can access their receipts from different devices without worrying about data loss. This feature is particularly useful for users who need to access their records while traveling or working remotely.

Another important technology used in the system is the login and authentication mechanism. This ensures that each user has their own private space to store receipts. Authentication helps protect user data and prevents unauthorized access. It also allows users to manage their receipts securely without worrying about privacy issues.

Categorization logic is another key component of the system. This logic is used to group receipts into different categories such as food, travel, shopping, and utilities.

Search and filtering functionality is also an important part of the system. These features allow users to quickly locate specific receipts based on different criteria such as date, category, or amount. Without these features, managing a large number of receipts would become difficult. The implementation of search and filter options improves user experience and makes the system more efficient.

The system is designed to be lightweight, meaning it does not require heavy software or complex configurations. This makes it accessible to a wide range of users and ensures that it can run smoothly on different devices. The use of simple and efficient technologies ensures that the system remains easy to maintain and update.

Another important aspect of the technology stack is its scalability. The system is designed to handle increasing amounts of data without affecting performance. As users continue to upload more receipts, the system can manage the data efficiently. This ensures that Smart Scan remains useful in the long term.

The technologies used also support integration between different components of the system. The frontend, backend, storage, and processing layers work together seamlessly to provide a smooth user experience. This integration ensures that data flows efficiently from one stage to another, from receipt upload to data extraction, storage, and retrieval.

In addition, the system is designed to be compatible with different devices, including mobile phones, tablets, and desktops. This ensures that users can access the system regardless of the device they are using. Device compatibility improves accessibility and makes the system more practical for everyday use.

Overall, the tools and technologies used in Smart Scan are chosen to balance simplicity, functionality, and efficiency. They provide all the necessary features required for receipt management while keeping the system easy to use and implement. The combination of frontend technologies, OCR, cloud storage, database management, and user authentication creates a complete and reliable system for managing receipts digitally

8. METHODOLOGY

Smart Scan works through a step-by-step process designed to keep the experience simple and easy for users. The first step is receipt collection. Users can upload receipts by taking a picture or selecting a file.

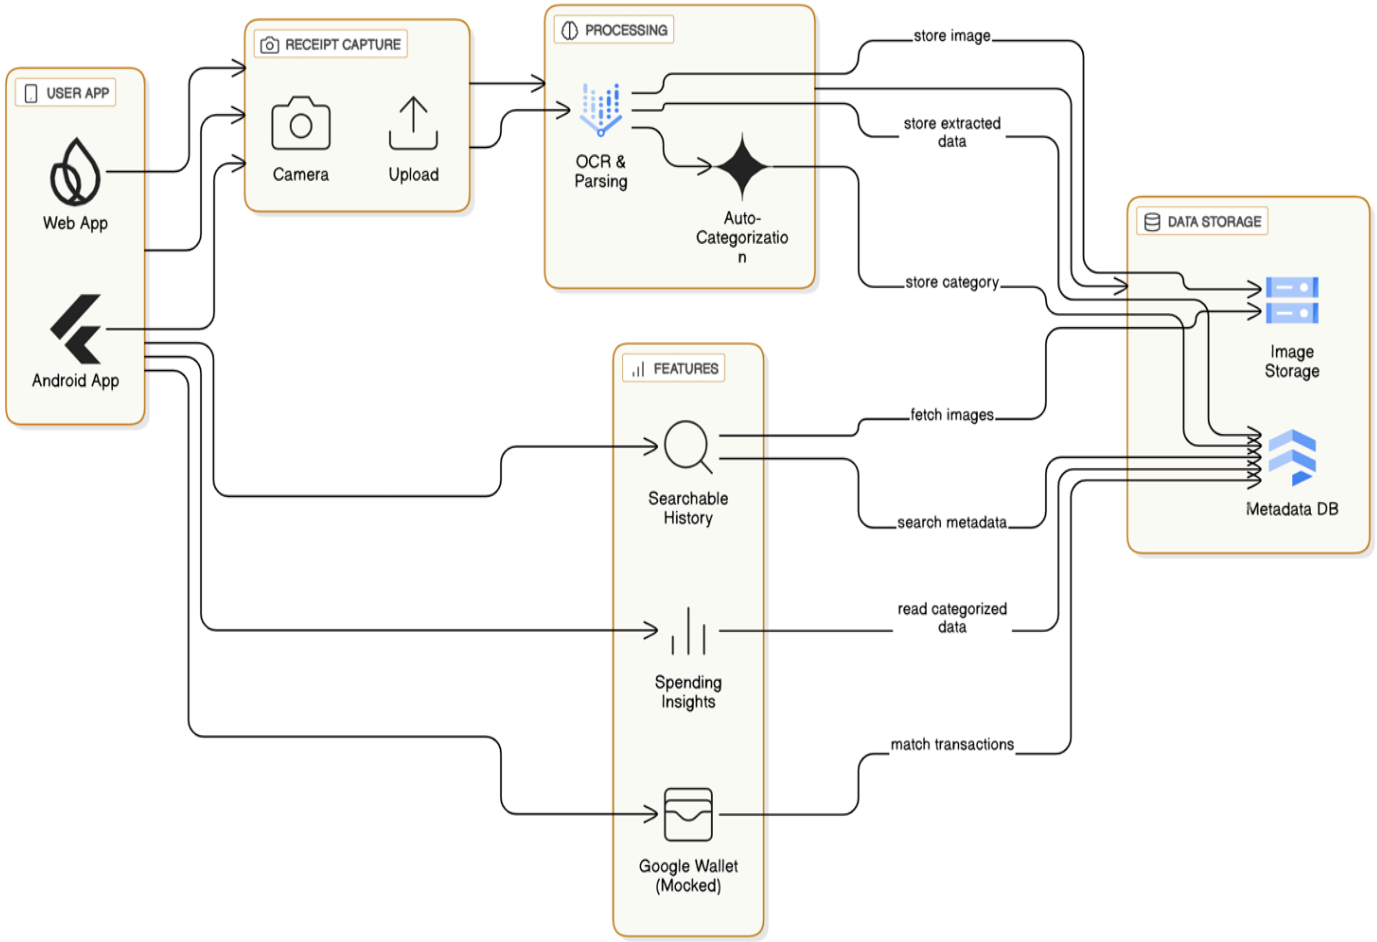
This makes it possible to store both paper receipts and digital ones in the same place. The system accepts different types of files to ensure convenience and flexibility.

Once a receipt is uploaded, the system moves to the extraction stage. Here, an OCR tool reads the text from the receipt image. It identifies the important parts like the date, merchant name, tax values, and total bill amount. This reduces the need for manual typing and helps maintain accuracy.

After the extraction stage, the receipt image along with the extracted details is stored safely in the database. This ensures that receipts are not lost and can be accessed whenever needed.

The next stage is categorization. The system groups receipts into categories such as food, travel, medical, shopping, groceries, and so on. Categorization helps users understand their spending patterns and find specific receipts quickly.

The final step is the user interface stage. Users can view their receipts, search for them, filter them by category or date, and check their past expenses. This makes the system helpful not only for storage but also for financial awareness. The methodology focuses on making the entire process smooth, efficient, and reliable.



In addition to the basic workflow already described, the methodology of Smart Scan is designed to ensure that each step is efficient, logical, and easy for users to follow. The system is built in a structured manner where each stage performs a specific function while contributing to the overall process. This step-by-step approach ensures that the system operates smoothly and delivers accurate results.

The first stage of the methodology focuses on user interaction and input. When a user accesses the system, they are provided with a simple interface that allows them to upload a receipt. This can be done either by capturing a photo using a camera or by selecting a file from the device.

The system ensures that this step is quick and straightforward so that users do not face any difficulty while uploading receipts. The goal is to minimize effort and encourage users to upload receipts regularly.

Once the receipt is uploaded, the system moves to the processing stage. In this stage, the receipt image is analyzed using OCR technology. The OCR tool scans the image and identifies text present on the receipt. It focuses on extracting relevant information such as the merchant name, transaction date, total amount, and tax details. This step is crucial because it converts unstructured image data into usable digital information. The accuracy of this step directly affects the overall performance of the system.

After extracting the text, the system enters the data validation and formatting stage. In this stage, the extracted information is checked and organized into a structured format. This ensures that all data follows a consistent pattern, making it easier to store and retrieve later. Any unnecessary or irrelevant data is ignored, and only useful information is retained. This step improves data quality and ensures that the system provides reliable results.

The next stage is data storage. Both the original receipt image and the structured data are stored securely. The system uses a storage mechanism that ensures data safety and accessibility. Receipt images are stored separately from the extracted data, allowing users to view both the original document and its processed information. This dual storage approach ensures that users have access to complete information whenever needed.

Following storage, the system performs categorization. In this stage, receipts are grouped into predefined categories such as food, travel, shopping, healthcare, and utilities. Categorization is based on the extracted data and helps users organize their receipts effectively. This step is important for improving usability, as it allows users to manage large numbers of receipts without confusion.

Another important stage in the methodology is indexing and retrieval preparation. The system prepares the stored data for quick access by organizing it in a way that supports fast searching. This ensures that users can retrieve receipts instantly without delays. Efficient retrieval is a key feature of Smart Scan and contributes to a better user experience.

The next stage focuses on user interaction with stored data. Users can view their receipts through a dashboard where all records are displayed in an organized manner. They can apply filters based on categories, dates, or amounts to find specific receipts. This stage ensures that users can easily navigate through their data and access the required information without difficulty.

Another important part of the methodology is synchronization. The system compares stored receipt data with simulated wallet transactions to identify missing or duplicate entries. This helps maintain consistency in financial records and ensures that all transactions are properly accounted for. This step adds an additional layer of accuracy to the system.

The methodology also includes continuous system improvement. As users interact with the system, feedback can be used to improve performance and usability. This ensures that the system remains effective and meets user needs over time. Regular updates and improvements help maintain the quality of the system.

Error handling is another important aspect of the methodology. The system is designed to handle situations where data extraction may not be accurate or when a receipt image is unclear. In such cases, the system ensures that users can still access the receipt image and make corrections if necessary. This improves reliability and ensures that users do not lose important information.

The methodology also focuses on maintaining system performance. As the number of receipts increases, the system should continue to operate smoothly without delays. Efficient data management and storage techniques are used to ensure that performance remains consistent even with large amounts of data.

Another key aspect is user convenience. The entire methodology is designed to reduce user effort and make the process as simple as possible. Each step is optimized to ensure that users can complete tasks quickly and easily. This encourages regular usage and helps users maintain organized records.

Finally, the methodology ensures that all components of the system work together seamlessly. From receipt upload to data extraction, storage, categorization, and retrieval, each stage is interconnected. This integration ensures that the system functions as a complete solution rather than a set of separate features.

In conclusion, the methodology of Smart Scan is designed to provide a structured, efficient, and user-friendly approach to receipt management. By dividing the process into clear stages and ensuring smooth interaction between them, the system delivers reliable results and improves the overall user experience. The methodology not only focuses on functionality but also emphasizes simplicity, accuracy, and efficiency, making Smart Scan a practical solution for managing receipts digitally.

ANNEXURE I:

Plagiarism Declaration Certificate

Title of Work: SMART SCAN
Submitted By: AARYAT KHATRI [2301201112]
Institution: K. R. Mangalam University, Gurugram
Department: BCA (AI&DS)
Date of Submission: 10 April 2026

I hereby declare that the work entitled **" SMART SCAN "** submitted for academic evaluation and research purposes is my original work. I confirm that:

- I have acknowledged and properly cited all sources, references, and data included in this work.
- This work does not contain any material previously published, written, or prepared by another person, except where due acknowledgment has been made.
- I understand that plagiarism is an academic offense and a violation of research ethics. Any breach of this declaration may lead to disciplinary action as per university policies.
- I have used appropriate referencing techniques and maintained academic integrity throughout this work.

I affirm that the submitted work has normal plagiarism less than 10% and free from AI content.
